

## Global data center for a leading component manufacturer

*How a leading automotive component manufacturer set up and benefited from its global data center in record time*

### **Business Situation**

The customer is one of the world's leading automotive component manufacturers, and was looking to outsource its global data center operations. The challenge was to take over about 60 servers with additional network connectivity and components in less than two days of time. Further the same had to be transferred and made available for critical applications in the shortest time.

### **Mahindra Satyam's Role**

Mahindra Satyam created a whole Data Center environment within the client's facility where all systems were tested in the new environment, before moving out. This is a 'Walk in Take Over' outsourcing deal where Mahindra Satyam has bought client's entire North America GDC including assets, support team and housed it at its own facilities.

Mahindra Satyam is now responsible for the global data center operation in North America and Europe, across eight time zones.

### **Business Benefits**

- High cost savings over the term of contract
- Improved availability of IT infrastructure for conducting business
- Improved Data Center problem solving capability
- Better support for development, test and production for thousands of users within US, Europe and Canada round the clock
